Introduction to the AMSOIL Lubricant Description and Cross Reference Guide

The following guidelines should always be utilized when using this Lubricant Description and Cross Reference Guide.

1. Proper lubricant application requires a working knowledge of the equipment being lubricated. This guide is only a tool that may be used to help in selecting the proper lubricant. Many other factors such as operating conditions must also be considered. Be sure that you have read and understand the **“Caution/Disclaimer”** statement found on page 4.
2. Viscosity Grades may be listed as “SAE”, “ISO” or “NLGI” grade numbers. Occasionally, the actual lubricant viscosity will not fall within established grade parameters. In those cases, the viscosity will be listed as its viscosity at 40° C, and called ISO grade. For example, an oil with a viscosity of 39 cSt @ 40° C is neither ISO 32 nor ISO 46, which are the recognized grades. Therefore, the oil will be listed as ISO 46, a non-recognized grade indicating its actual viscosity at 40° C.
3. Because API service categories change frequently, competitor brands may not reflect their current specification. For example, an oil listed as meeting API SH/CD may have been upgraded so it now meets API SL/CF. Compare the current competitors’ specifications to those of the potential AMSOIL replacement product. AMSOIL products are listed under their **“Application Code”** as one of the following:

APPLICATION CODES:

- A.** Recommended replacement. Product is very similar in composition.
 - B.** Superior product. The original lube is probably petroleum based, and is not as good as the synthetic AMSOIL product.
 - C.** May be suitable, self evaluate. In many cases the AMSOIL product is an excellent substitute, but may be different in some way that is significant for some applications.
 - D.** Not used.
 - E.** No direct replacement. AMSOIL does not have a lubricant that can be used as a direct replacement.
 - F.** Consult AMSOIL for recommendations. AMSOIL Technical Service may be able, based on operating conditions and other factors, to recommend a suitable AMSOIL lubricant. However, they will need to know all of these conditions to make a recommendation.
 - G.** Grease composition may not be compatible. Thickeners used in various greases may not be compatible with those used in others. If this occurs, the grease may lose its consistency and more frequent re-lubrication will be required until all of the old grease is purged or cleaned out of the system. Due to this possibility, unless the thickeners match up, we have listed greases which use different thickeners than AMSOIL as **“No direct replacement”** in this guide.
4. If there is any doubt as to the suitability of an AMSOIL product, contact AMSOIL Technical Services for assistance.
 5. AMSOIL welcomes any information from users of this database, which can update, modify or add to the future value of this database.
